

E5 | Equal-budget source-label discrimination

C1 quality-controlled same-prompt subset: 902 items (445 positive, 457 hard-negative) · 8 events

A = earlier; B = later; D = B – A. Every condition retains 192 token positions. Zero blocks retain projector/type effects.

Intervals resample 8 paired events 5,000 times within each seed. Seeds are repeated fits, not additional independent events.

Later, delta and full_no_delta comparisons are descriptive. The -0.05 line alone is not the full preregistered decision rule.

Exposed development data · Source-label agreement is not proof of temporal reasoning or memory benefit.
