

A 12-day approximation hides the variation in observation intervals

All 7,000 catalog tiles, by split

Frozen E5 primary: 902 items / 8 events

Original metadata + published GEO-Bench slot mapping; 7,000 unique exact geometry/metadata joins.
Six of the eight E5 primary events have intervals of 36–288 days. Its item-weighted median is still 12 days.
Day-level source dates; historical raster correspondence and acquisition UTC remain unverified.
Descriptive input audit only. E5 inputs are unchanged; no model-output association or causal claim.
